

BWC Hapily Subscription → Contact Sync

Purpose

Keep the Contact aligned to the correct Hapily subscription record.

The Contact should reflect:

- `status_of_membership`
- `billing_start_date`
- `billing_end_date`
- `products`
- `coupon`
- `discount`

Source of truth

- Stripe is the upstream billing system.
- Hapily writes subscription lifecycle data into HubSpot custom object records.
- The serverless function reads the HubSpot Hapily subscription records and updates the Contact.

Core logic

1. Resolve the Contact associated with the triggering Hapily Subscription record.
2. Load all associated Hapily Subscription records for that Contact.
3. Exclude any record where:
 - `subscription_type` is populated
 - `subscription_status` is blank
 - `subscription_id` is blank
 - `billing_start_date` is missing
 - `billing_end_date` is missing
4. Group the remaining records by Stripe `subscription_id`.
5. Within each `subscription_id`, choose one representative record by:
 - latest `billing_start_date`
 - then latest `hs_createdate`
 - then highest HubSpot object ID
6. Compare the representatives across lifecycle groups using the same order:
 - latest `billing_start_date`
 - then latest `hs_createdate`
 - then highest HubSpot object ID
7. Copy the winning subscription fields to the Contact.
8. Reconcile the **Current Subscription** label to that winner.

Important rule

- `billing_start_date` is the primary winner field.
- `hs_createdate` is only a tie-breaker.
- `billing_end_date` is required for eligibility, but it does not pick the winner.
- `subscription_status` is copied from the winner, but it does not pick the winner.

Manual review exception

Do not auto-select a winner when all of the following are true:

- the standard winner would be `cancelled`
- there is a competing eligible `active` subscription
- the `active` subscription has `paid_through`
- the case appears merge-affected or tied to a deleted Stripe subscription lineage

In that case:

- do not overwrite Contact subscription fields
- do not auto-move the Current Subscription label
- set anomaly / manual review fields

Anomaly behavior

If no safe winner exists, the function does not overwrite the Contact.

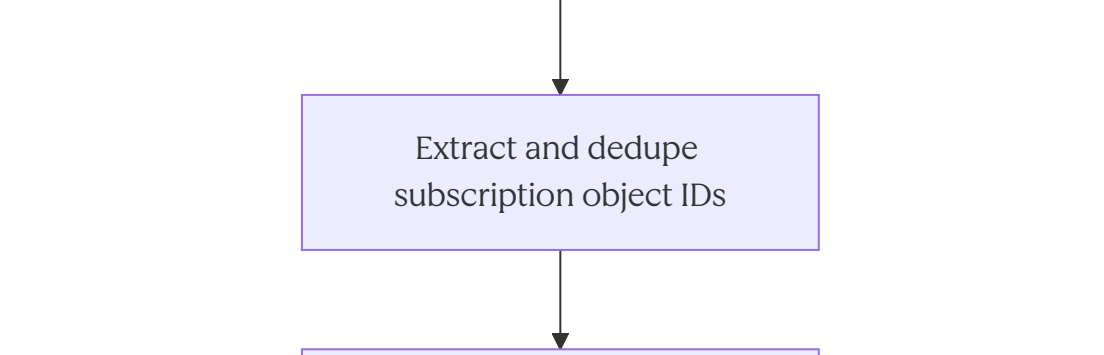

It writes:

- `subscription_sync_anomaly`
- `subscription_sync_anomaly_reason`

Those fields are cleared once a safe winner is found later.

Data flow

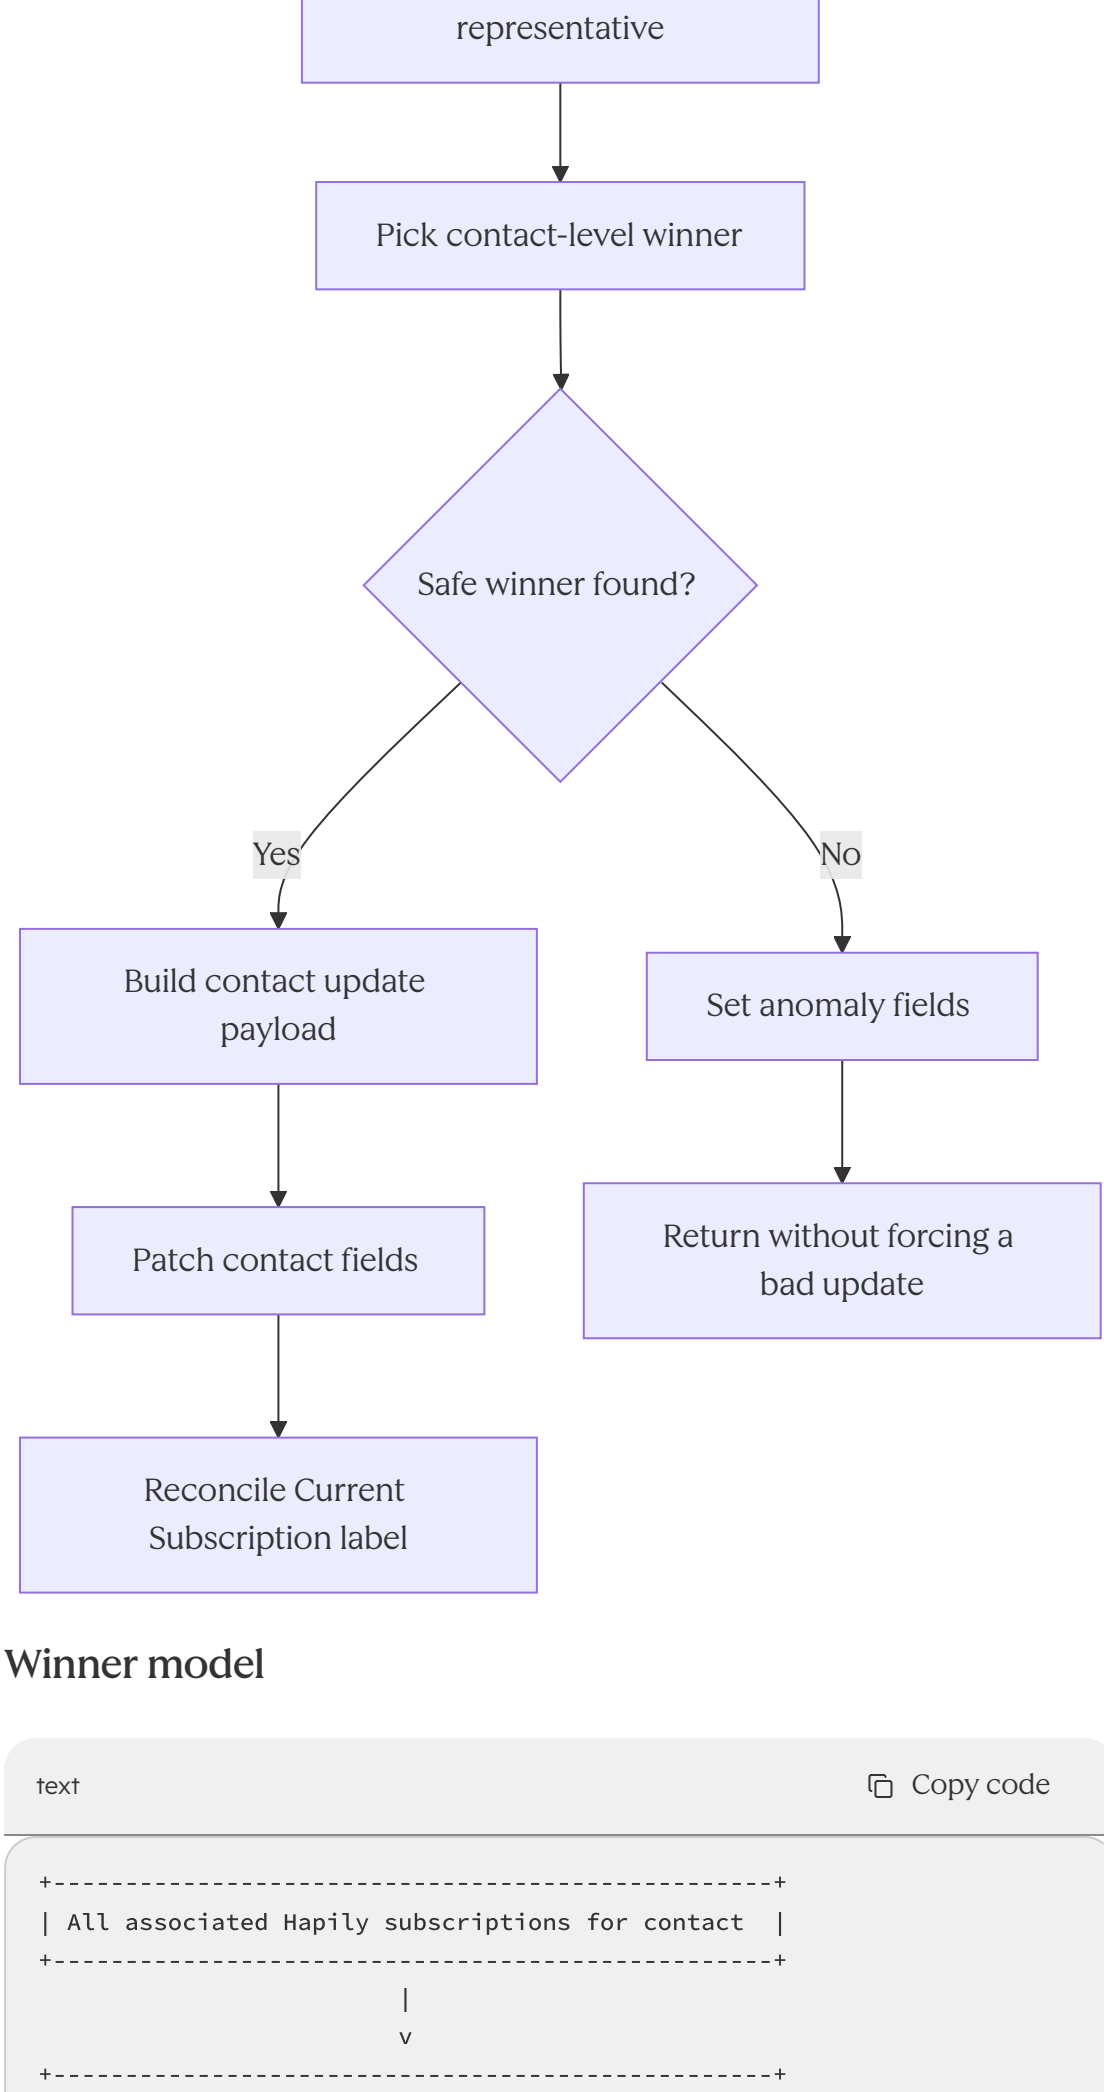

Business flow

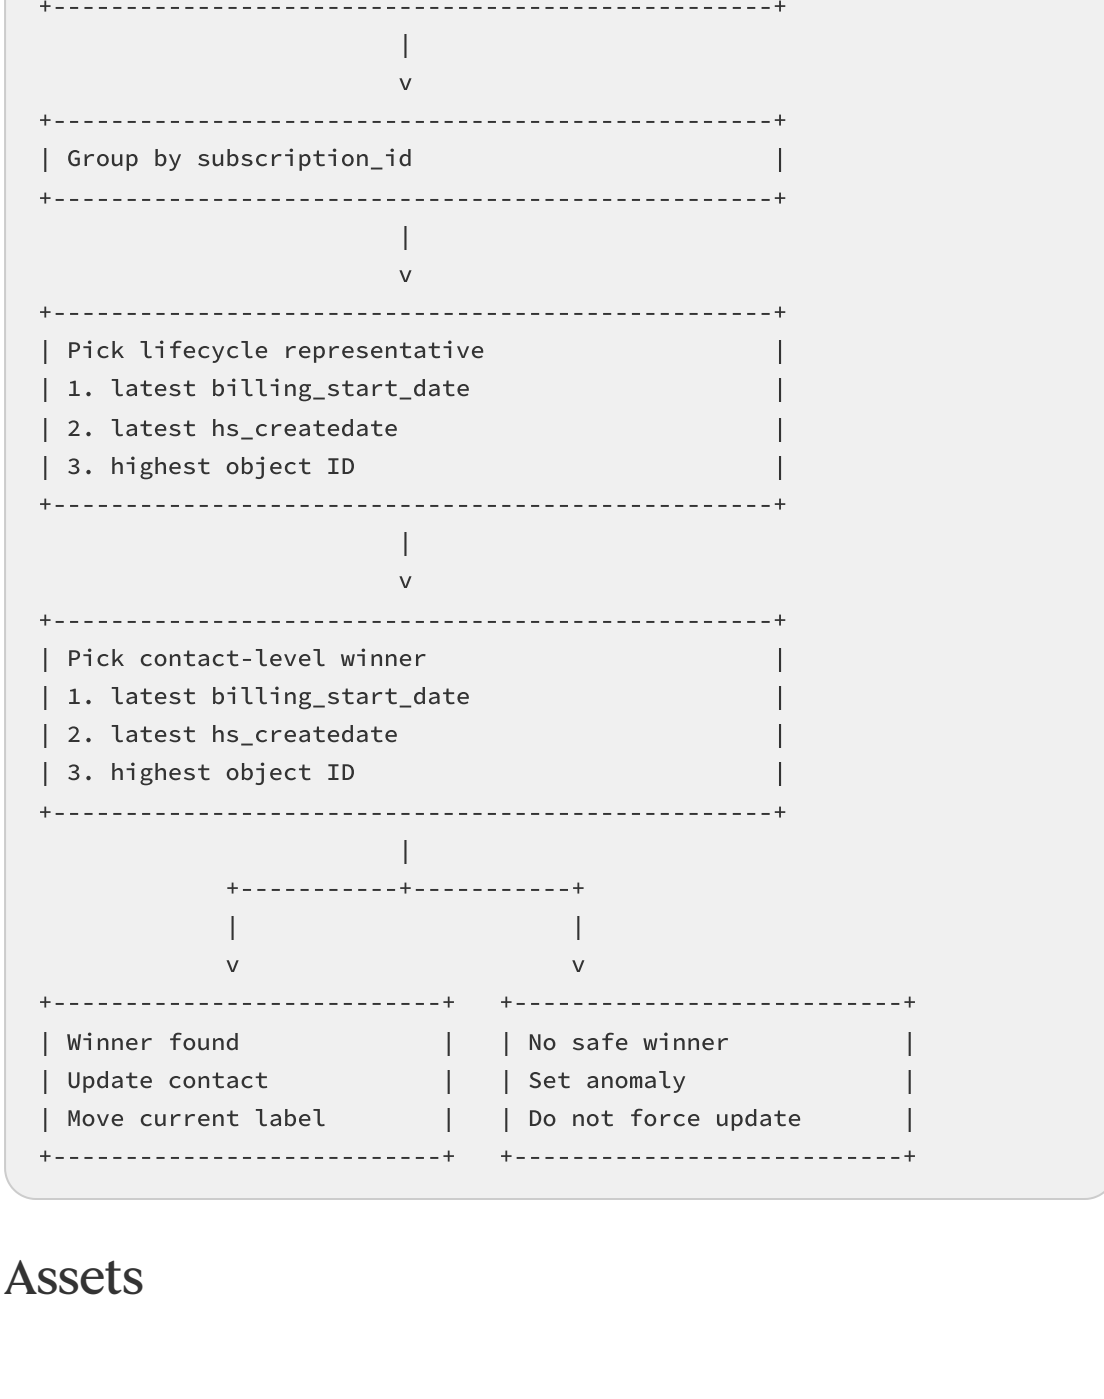

What this means

- Stripe is the upstream billing source.
- Hapily mirrors that lifecycle into HubSpot subscription records.
- The serverless function uses the HubSpot Hapily records to keep the Contact current.
- Cancellation-request workflows are separate and should not replace live subscription state.

Internal function flow

Winner model

Assets

HubSpot objects

Hapily Subscription custom object

- object type: `2-32975090`
- role: source object used to determine the authoritative subscription

Contact

- object type: `0-1`
- role: destination object updated by the serverless function

Contact fields updated by the function

From Hapily Subscription → Contact:

- `subscription_status` → `status_of_membership`
- `billing_start_date` → `billing_start_date`
- `billing_end_date` → `billing_end_date`
- `products` → `products`
- `coupon` → `coupon`
- `discount` → `discount`

Contact review / anomaly fields

- `subscription_sync_anomaly`
- `subscription_sync_anomaly_reason`

Contact cancellation-intent fields

These are separate from live subscription state:

- `requested_cancellation`
- `requested_cancellation_date`

Association label

Current Subscription

- Contact → Hapily Subscription custom association label
- used to mark the authoritative winning subscription on the Contact
- settings reference: <https://app.hubspot.com/settings/44020082/objects/0-1/associations/2-32975090>

Review list

Contacts With Conflicting Data

- review segment: <https://app.hubspot.com/contacts/44020082/objectLists/1116/filters>
- use this list to review contacts where the subscription data is conflicting or requires manual validation

Scripts / implementation assets

Production sync script

- `updateContactFields.js`
- billing-start-first logic with manual-review exception

Important call outs

- The function should not trust the triggering subscription alone.
- The function must expand to the full contact-level subscription set.
- The function must choose the winner by `billing_start_date` first.
- `hs_createdate` is only a tie-breaker.
- Status is carried from the winner; it is not the winner rule.
- The Current Subscription association label should follow the same winning record.
- Merge / deleted-subscription conflicts with active payment evidence go to manual review instead of auto-selection.
- The review segment should be used to monitor and resolve conflicting cases without forcing bad updates.
